PROFESSIONAL SUMMARY

Software Engineer with 2 years of experience developing scalable backend systems and data-driven applications using Python. Proficient in building RESTful APIs, implementing machine learning pipelines, and managing cloud infrastructure. Strong background in full-stack development with expertise in modern frameworks, databases, and distributed systems. Passionate about creating efficient solutions that solve complex technical challenges.

EDUCATION

University of Texas at Arlington <i>Master's Degree in Computer Science – GPA: 3.7</i>	Arlington, TX January 2024 – Present
Savitribai Phule Pune University <i>Bachelor's Degree in Computer Engineering – CGPA: 8.26</i>	Pune, India Graduated June 2022

TECHNICAL SKILLS

Programming Languages: Python, Java, C++, C, Bash, JavaScript
Backend & Frameworks: RESTful APIs, Microservices, Flask, Django, FastAPI, Node.js
Databases: MongoDB, MySQL, PostgreSQL, Oracle, Neo4j
Cloud & DevOps: AWS (EC2, S3, Lambda), Docker, Git, GitHub
Data & ML Tools: Apache Spark, PyTorch, LangChain, OpenAI API, Pandas, NumPy
Web Technologies: React, AngularJS, HTML5, CSS, Firebase
Operating Systems: Linux (Ubuntu, CentOS), Windows

PROFESSIONAL EXPERIENCE

Software Engineer <i>Elata Technologies</i>	August 2022 – December 2023 Pune, India
- Designed and developed Python-based backend services and automation frameworks that reduced manual processing time by 60 percent, significantly improving operational efficiency and enabling the team to handle increased deployment cycles. - Integrated LLM capabilities to build an intelligent log analysis tool that automatically categorizes error patterns and suggests troubleshooting steps, reducing mean time to resolution for production incidents. - Built and maintained RESTful APIs using Flask to handle complex data processing workflows, integrating seamlessly with MongoDB and MySQL databases to ensure reliable data persistence, validation, and retrieval for mission-critical applications. - Created automation frameworks using Python with Ansible for configuration management and deployment orchestration, streamlining system configurations and reducing deployment errors across multiple environments. - Developed containerized applications using Docker to ensure consistent environments across development, testing, and production systems, eliminating environment-specific bugs and simplifying the onboarding process for new developers. - Implemented monitoring and observability solutions using Prometheus and Grafana to track application performance metrics and system health, enabling proactive identification of bottlenecks and performance optimization. - Worked with cross-functional teams to gather requirements and deliver software features that addressed business needs, contributing to successful project deliveries and iterative improvements. - Maintained and configured Linux server infrastructure including user management, package installations, log monitoring, and system updates, while utilizing Splunk for centralized log aggregation and analysis to troubleshoot production issues.	
Software Engineer Intern <i>Elata Technologies</i>	September 2019 – March 2020 Pune, India
- Developed dynamic and responsive web application features using AngularJS, HTML5, and CSS, creating intuitive user interfaces that improved user engagement and reduced bounce rates significantly. - Designed and implemented normalized database schemas for application data, writing optimized SQL queries with proper indexing strategies that improved query performance and supported seamless scaling. - Built robust automation scripts using Python and Bash to handle repetitive development tasks such as data migration, log parsing, and report generation, saving significant manual effort for the team.	

- Actively participated in code reviews and pair programming sessions with senior developers, learning industry best practices for writing clean, maintainable code and improving code quality metrics across the codebase.
- Utilized Git for version control in an Agile development environment, managing feature branches, resolving merge conflicts, and coordinating pull requests to ensure smooth collaboration across the development team.

ACADEMIC PROJECTS

Hybrid Information Retrieval with Knowledge Graphs and LLMs

- Built a hybrid Retrieval-Augmented Generation (RAG) pipeline combining Neo4j Knowledge Graphs with vector search via LangChain and OpenAI, enhancing contextual accuracy and achieving a BERTScore F1 of 0.8691, outperforming traditional retrieval models.
- Implemented LLM-driven entity and relation extraction to auto-generate a Neo4j knowledge graph from raw Wikipedia text, enabling structured retrieval and boosting query response relevance by 40 percent in complex information requests.

FlavourFind – Full-Stack Recipe Application

- Developed a full-stack application to fetch and customize recipes from the Spoonacular API by integrating user-specific preferences for diet, cuisine, and allergies. Leveraged React for creating an intuitive and responsive UI, and Django for backend logic and API integration. Delivered personalized recipe recommendations with ingredient details, nutritional information, and a grocery list feature.
- Implemented Firebase for real-time data storage and secure user authentication, ensuring seamless data retrieval and robust login management. Enhanced functionality with interactive features like grocery list generation, enabling users to organize shopping needs efficiently.

Distributed Housing Price Prediction with Apache Spark

- Deployed scalable linear regression workflows on Apache Spark in a cloud environment, enabling distributed training over the Boston Housing dataset and accelerating predictive insights for real estate valuation.
- Utilized cloud-based Spark clusters to experiment with linear modeling techniques, reducing compute time by 30 percent and demonstrating the effectiveness of parallelized data transformations for high-volume housing data analysis.
